INCREASING ENERGY EFFICIENCY

SITUATION.

In line with national climate goals, the Government of Canada was looking for an opportunity to decrease greenhouse gas (GHG) emissions associated with mining by promoting energy efficiency in the sector.

Between 1990 and 2015, energy use in the Canadian industry had decreased by 32%, while in the mining industry it increased by 9%.

THE ROLE OF MITRAQ.

MiTRAQ was contracted by the Department of Natural Resources Canada to launch the first nationwide energy consumption benchmarking system among the mining companies.

IMPACT.

Over the first year of the project, the benchmarking platform was joined by more than 20 mining companies, providing them with the tools needed to identify where and how improvements to energy efficiency could be made.
